Midrand, South Africa**

Nov 10 – 11, 2014

Outline

- ❖ A substantial share of emission increase in Africa in the next few decades will come from cities
- ❖ A broad diversity of opportunities exist to keep these emissions at bay while even increasing services
 - ❑ Urban form
 - ❑ Building energy efficiency
 - ❑ Embodied energy and emissions in infrastructure
- ❖ Energy efficiency has been a very powerful tool to keep emissions and energy use at bay worldwide
- ❖ Many energy efficiency opportunities exist that also contribute to development goals rather than compromise them
- ❖ However, there is a major lock-in risk

A substantial share of emission increase in Africa in the next few decades will come from cities

- ❖ **Urban areas generate 80% of GDP and 71% - 76% of CO2 emissions from global energy use**
- ❖ **Each week the urban population increases by 1.3 million**
- ❖ **By 2050 urban population is to increase by up to 3 billion**
- ❖ **Over 70% of global building energy use increase will take place in developing country cities**
- ❖ **This enormous expected increase poses both an opportunity and responsibility**

A broad diversity of opportunities exist to keep these emissions at bay while increasing services

- ❖ Urban design and form
- ❖ Energy efficient buildings
 - ❑ low-energy architecture
 - ❖ avoiding cooling needs
 - ❑ High-efficiency appliances, lighting and equipment
 - ❑ High performance operation of buildings (mainly commercial)
- ❖ Fuel switch to low-carbon energy sources (RES) or high-efficiency equipment using energy contributing to CC
 - ❑ Hi eff cookstoves
- ❖ Lowering embodied energy in the built infrastructure –
 - ❑ affordable low-carbon, durable construction materials

Mitigation through urban design

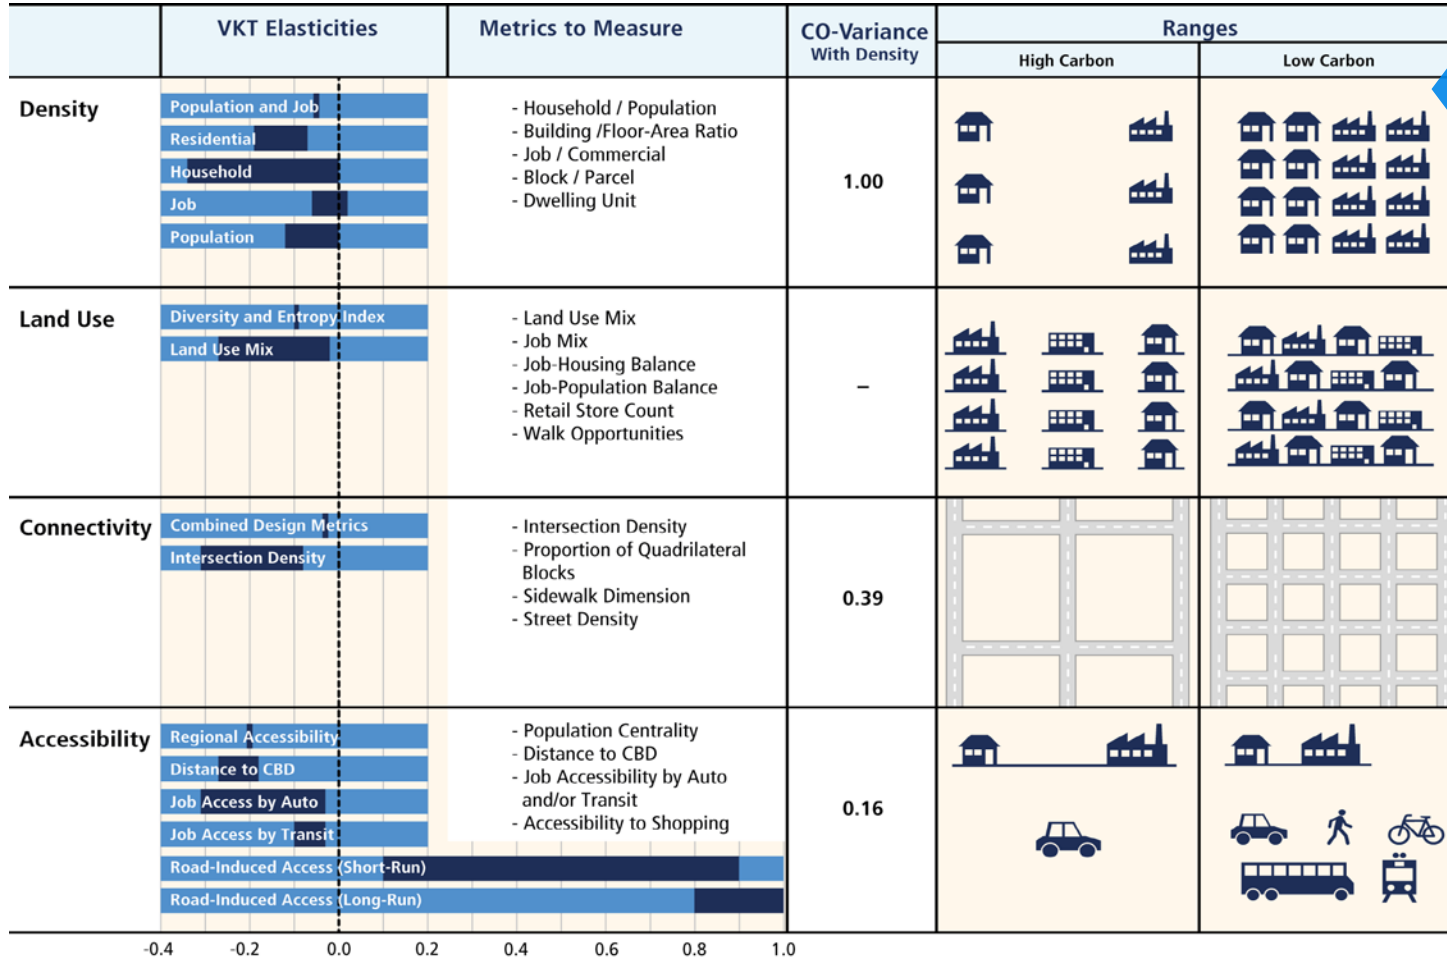

Infrastructure and urban form are strongly linked and lock-in patterns of land use, transport and housing use, and behavior

	VKT Elasticities	Metrics to Measure	CO-Variance With Density	Ranges	
				High Carbon	Low Carbon
Density	<ul style="list-style-type: none"> Population and Job Residential Household Job Population 	<ul style="list-style-type: none"> - Household / Population - Building /Floor-Area Ratio - Job / Commercial - Block / Parcel - Dwelling Unit 	1.00		
Land Use	<ul style="list-style-type: none"> Diversity and Entropy Index Land Use Mix 	<ul style="list-style-type: none"> - Land Use Mix - Job Mix - Job-Housing Balance - Job-Population Balance - Retail Store Count - Walk Opportunities 	-		
Connectivity	<ul style="list-style-type: none"> Combined Design Metrics Intersection Density 	<ul style="list-style-type: none"> - Intersection Density - Proportion of Quadrilateral Blocks - Sidewalk Dimension - Street Density 	0.39		
Accessibility	<ul style="list-style-type: none"> Regional Accessibility Distance to CBD Job Access by Auto Job Access by Transit Road-Induced Access (Short-Run) Road-Induced Access (Long-Run) 	<ul style="list-style-type: none"> - Population Centrality - Distance to CBD - Job Accessibility by Auto and/or Transit - Accessibility to Shopping 	0.16		

-0.4 -0.2 0.0 0.2 0.4 0.6 0.8 1.0

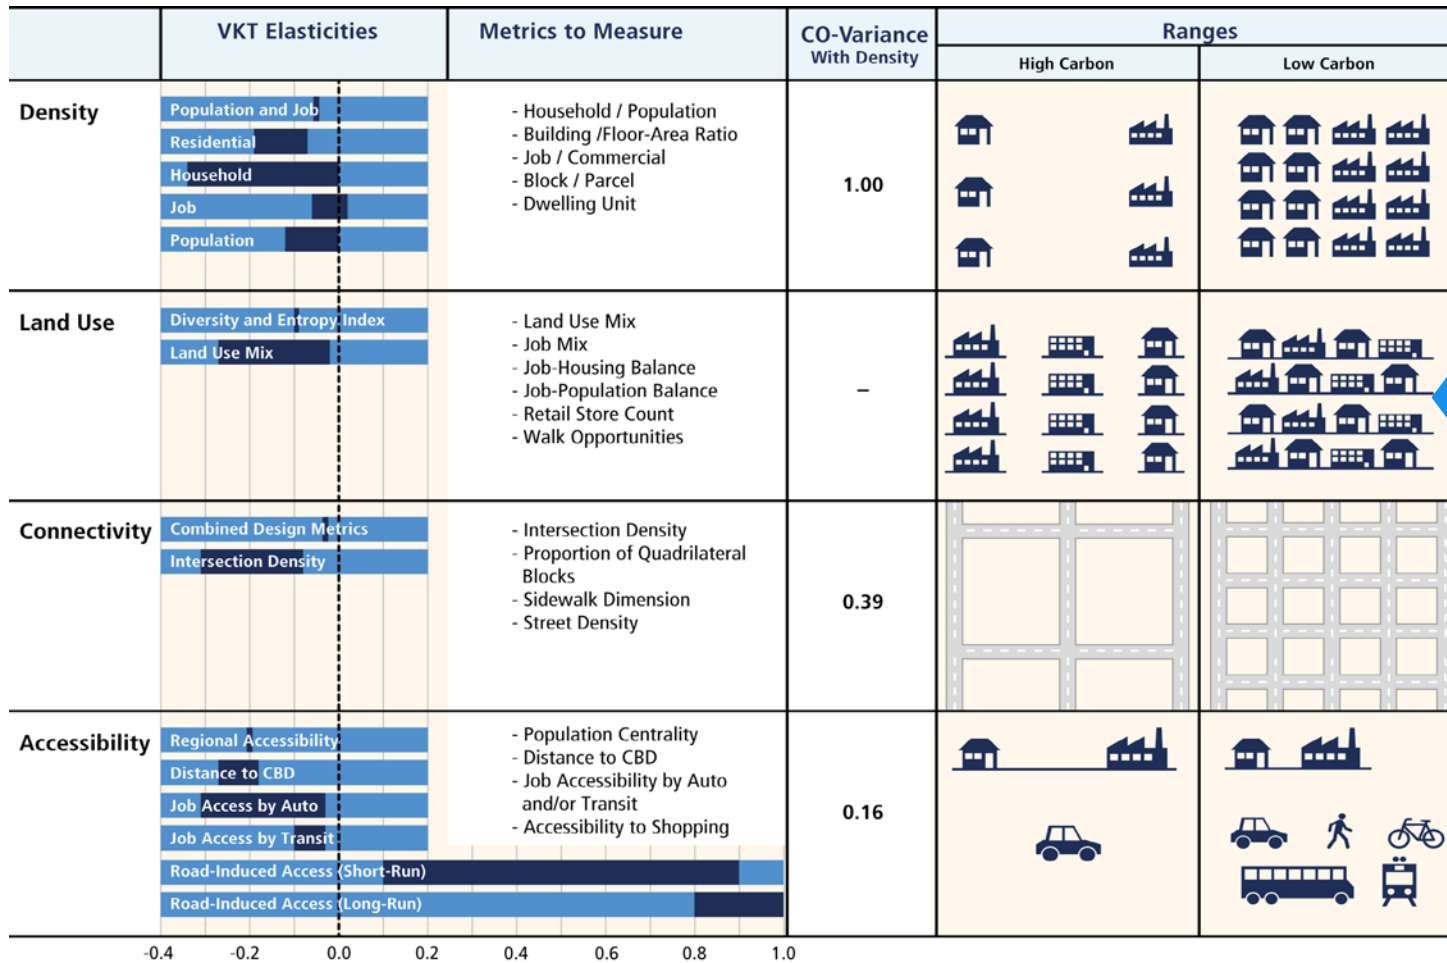

Increasing and co-locating residential and employment densities can lower emissions

Higher density leads to less emissions (i.a. shorter distances travelled).

Increasing land use mix can significantly reduce emissions

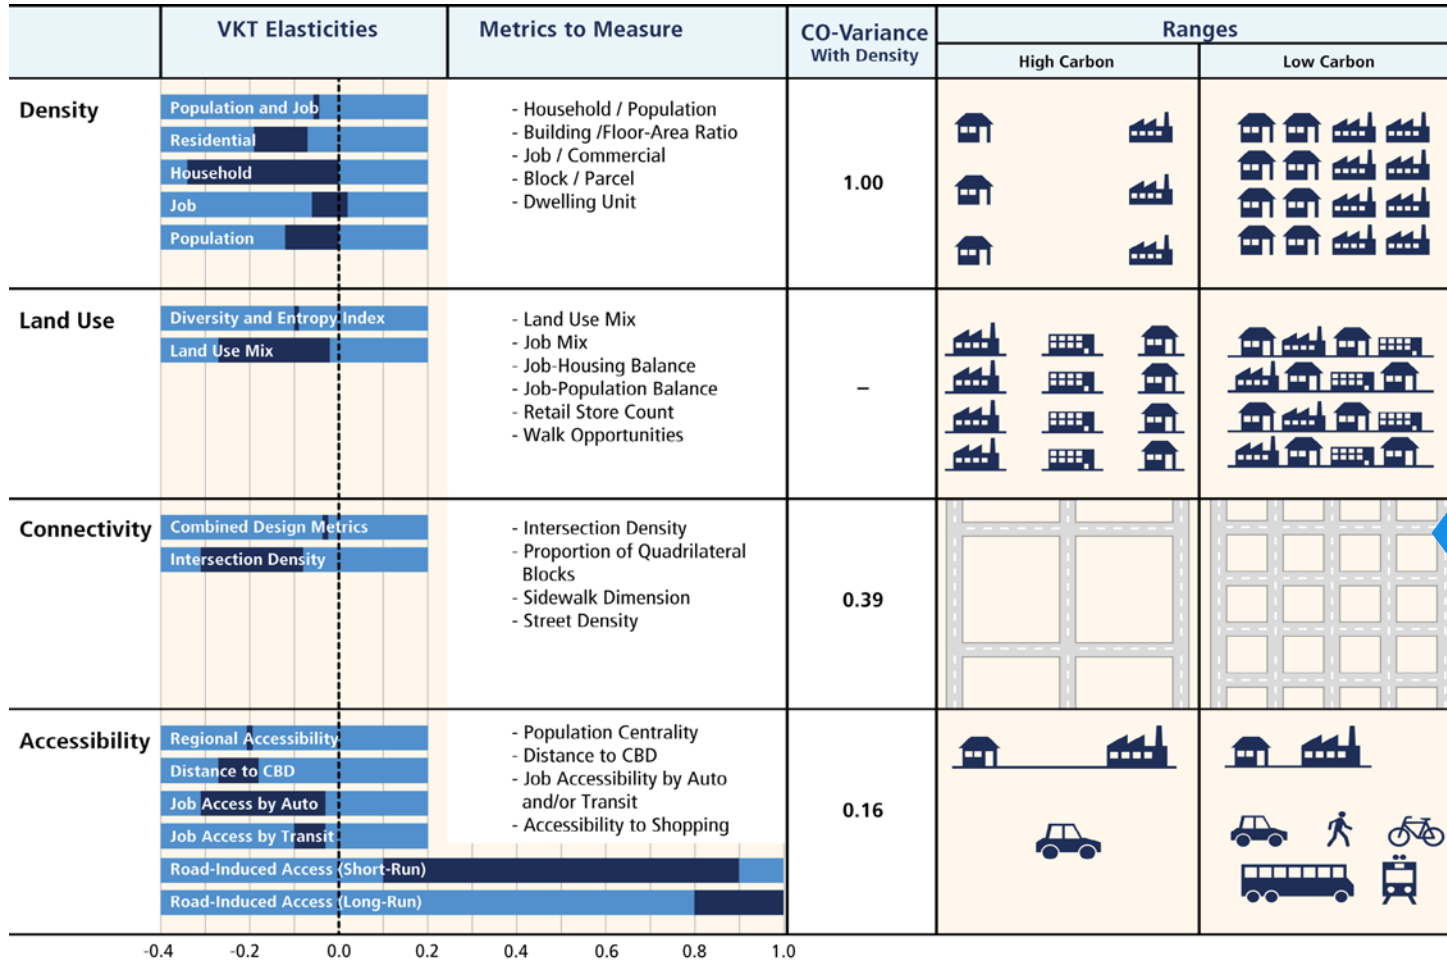

Mix of land-use reduces emissions.

To lower urban emissions, need diverse urban land use mix

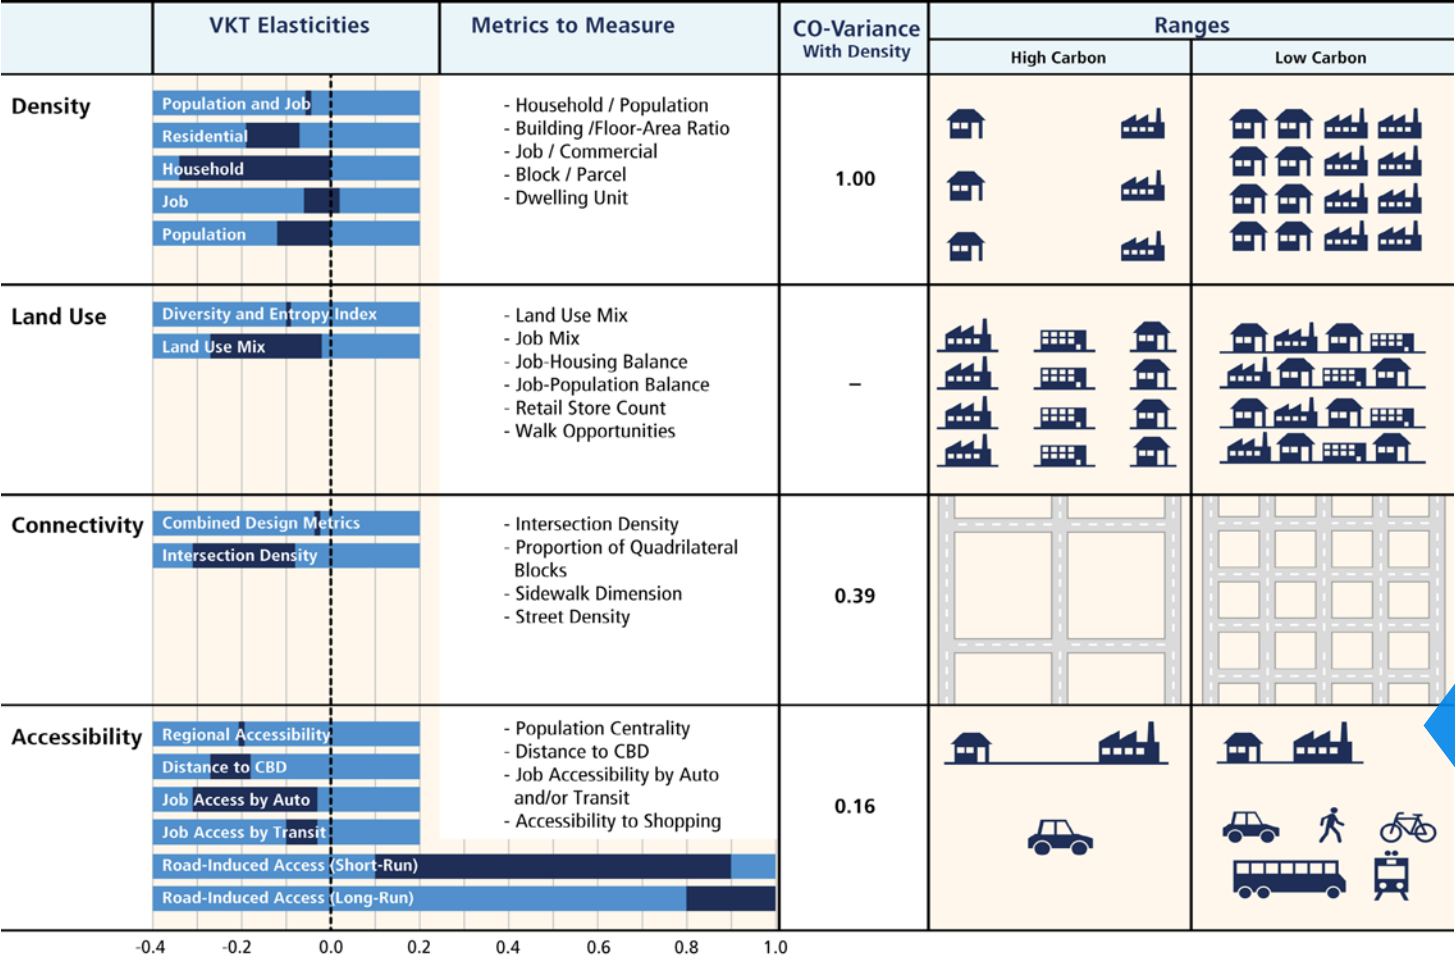

Increasing connectivity can enable multiple modes of transport

Improved infrastructural density and design (e.g. streets) reduces emissions.

Co-location of activities reduces direct and indirect GHG emissions

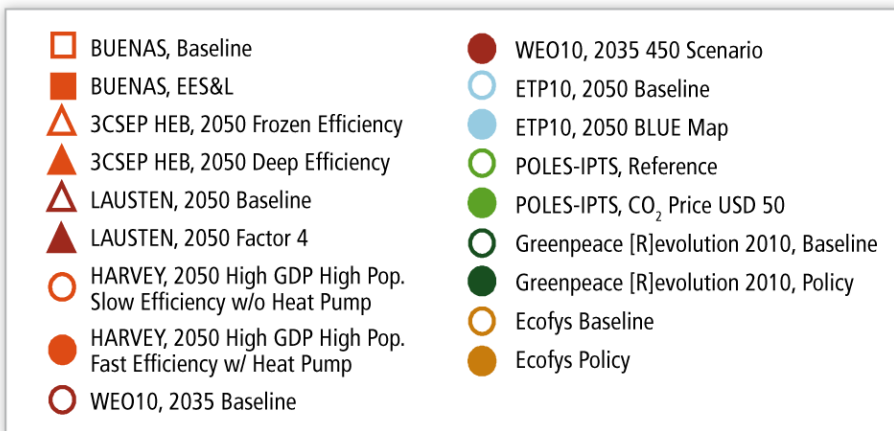

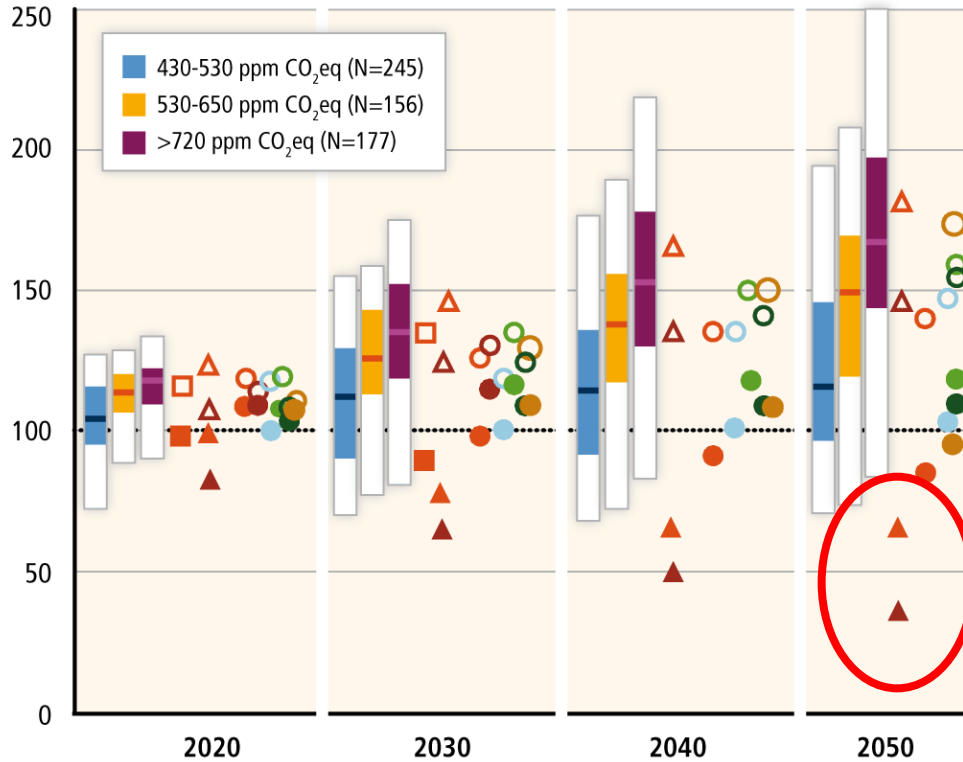

Accessibility to people and places (jobs, housing, services, shopping) reduces emissions.

Mitigation opportunities through urban planning:

1. increasing accessibility
2. increasing connectivity
3. increasing land use mix
4. increasing transit options
5. increasing and co-locating employment and residential densities
6. increasing green space and other carbon sinks
7. Increasing white and light-colored surfaces

Normalized Global Buildings Final Energy Demand (2010=100)

**Energy efficiency
in buildings can
substantially lower
sectoral energy
use;
thermal uses are
most reducible**

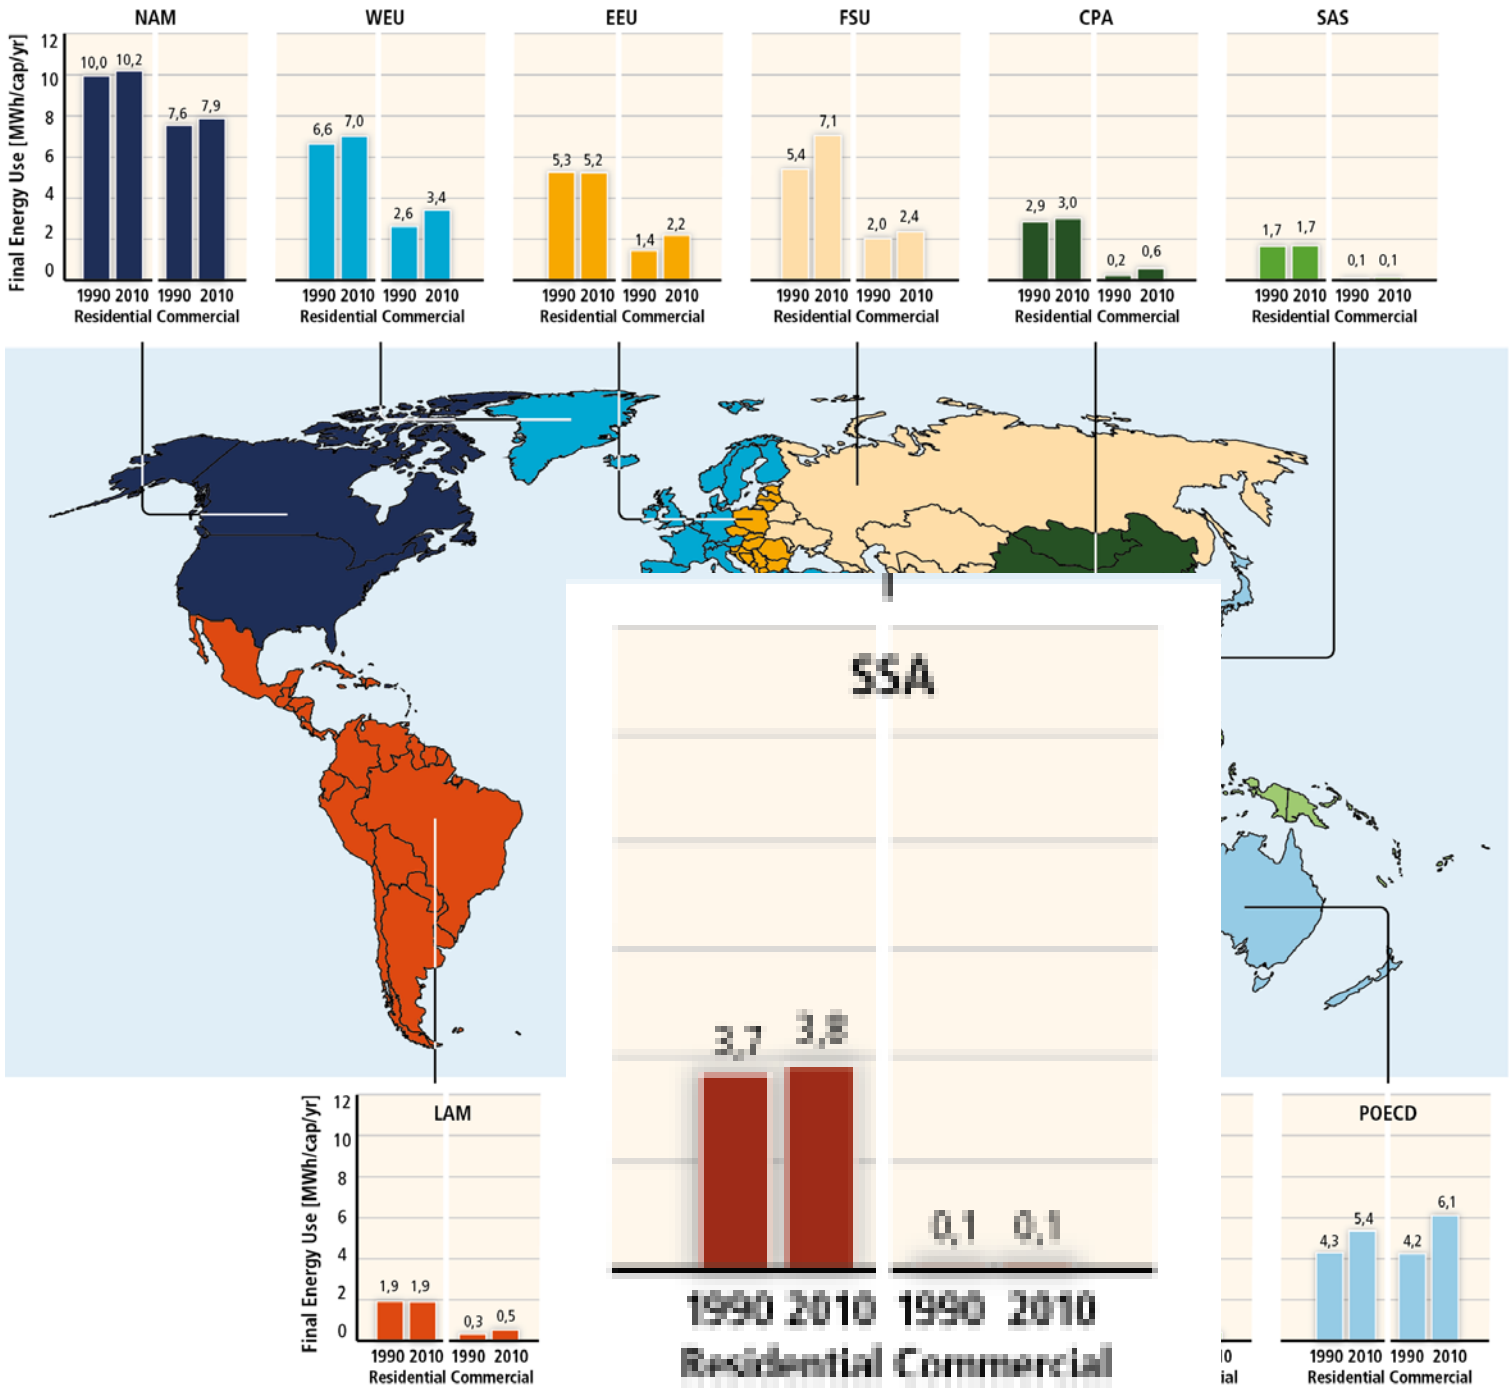

*for further details on
mitigation options and
potentials, see Chapter 9*

Increased efficiency has been a very powerful tool to keep emission and energy demand increases at bay for decades

Per capita residential and commercial energy use, 1990 - 2010

Urban and buildings-level mitigation options can also contribute towards development goals

CENTER FOR CLIMATE CHANGE
AND SUSTAINABLE ENERGY POLICY

CENTRAL EUROPEAN UNIVERSITY

“Overall, the potential for co-benefits for energy end-use measures outweigh the potential for adverse side-effects, whereas the evidence suggests this may not be the case for all energy supply and AFOLU measures.” (SPM 4.1)

How mitigation options can go hand-in-hand with development goals in Africa (co-benefits)

- ❖ Health – 2 m annually die from indoor air pollution from cooking, many women and children
- ❖ Increased productive time for women and children
- ❖ Air quality improvement – indoor and outdoor
- ❖ decreasing the burden of energy generation capacity development needs
- ❖ Efficiency increases access to energy services
 - ❑ Contribution to poverty alleviation
- ❖ Decreased needs for energy imports (energy security)
- ❖ Better employment and economic opportunities through accessivity
- ❖ Reduced congestion
- ❖ Several mitigation options in buildings have been shown to have net negative social mitigation costs

Cost of conserved carbon for implemented energy efficiency programs, post-ante evaluation results (based on data in Table 9.9 (boza-kiss et.al 2013 in COSUst)

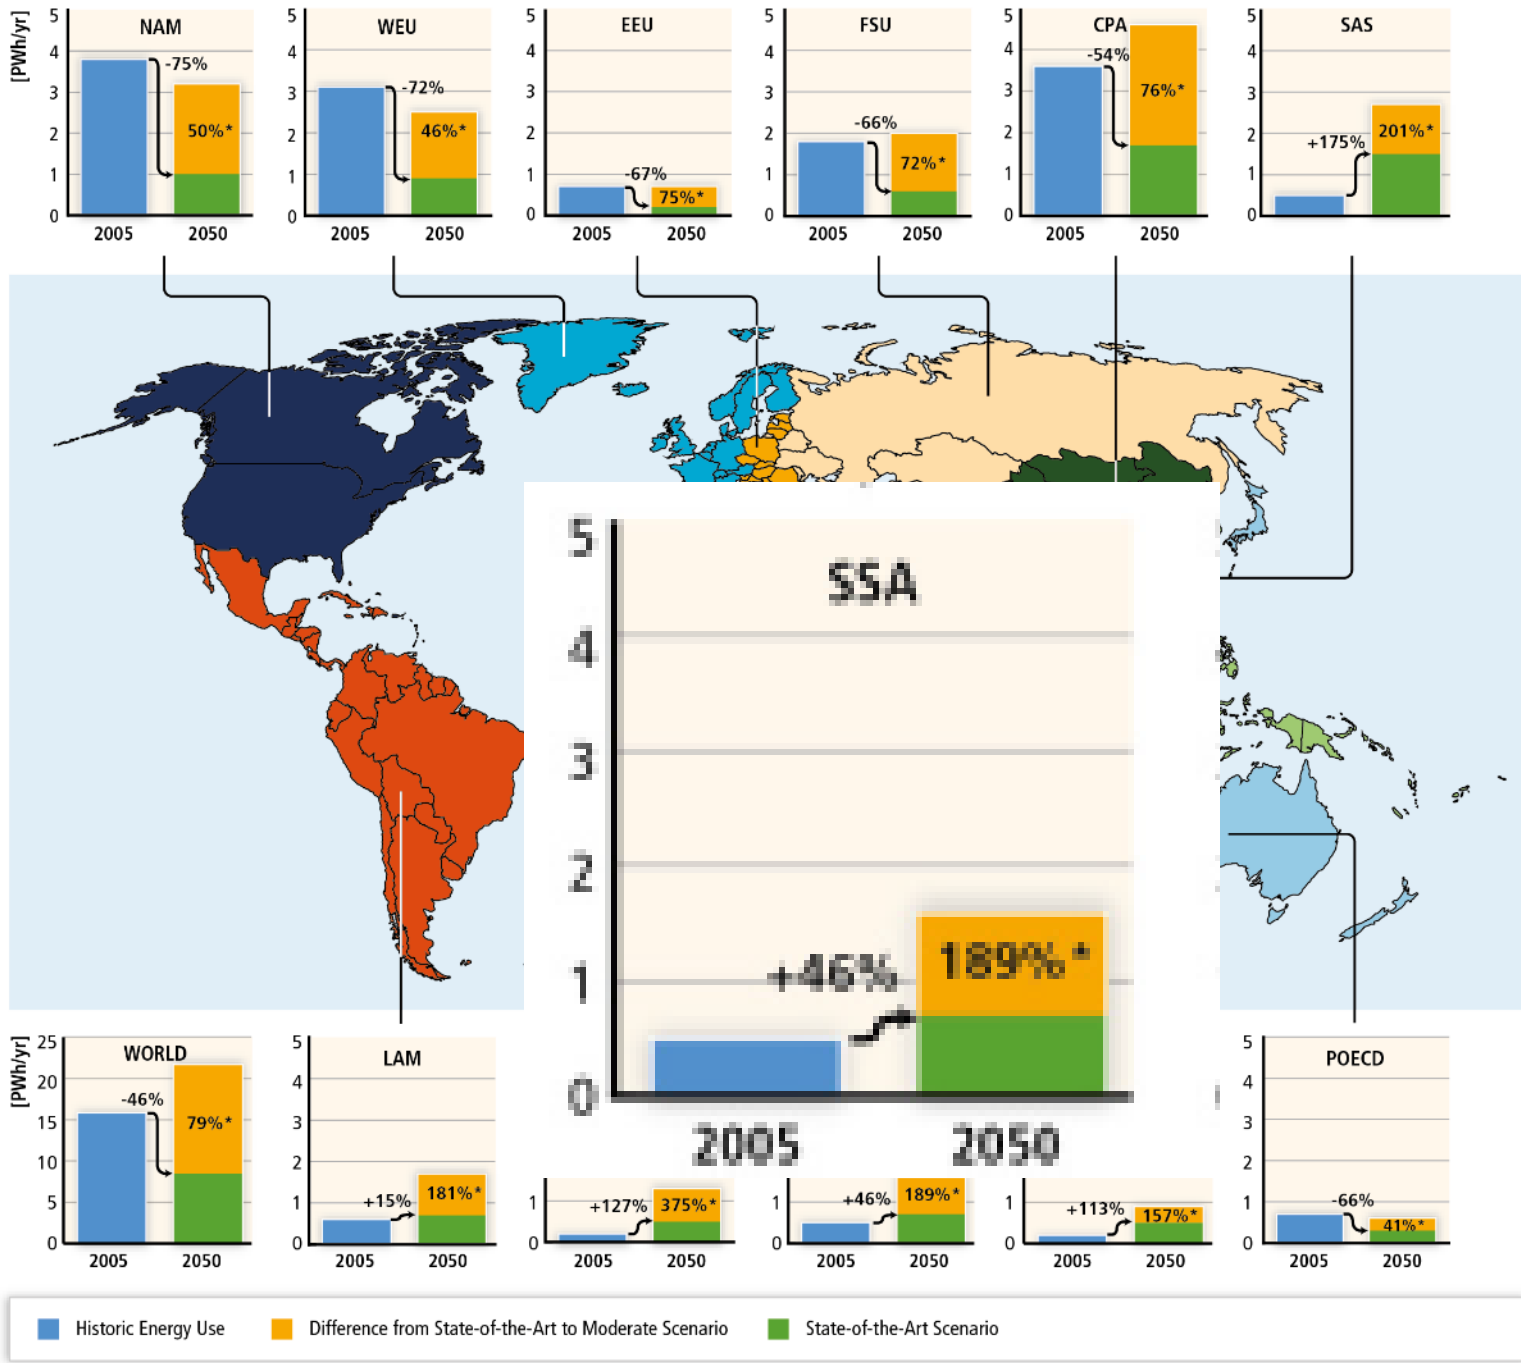

However, there is a major lock-in risk

The Lock-in Risk: global heating and cooling final energy in two scenarios

The lock-in risk: heating and cooling energy demand by two scenarios

*Lock-in Risk of Sub-Optimal Scenario Relative to Energy Use in 2005.

Thank you for your attention

CENTER FOR CLIMATE CHANGE
AND SUSTAINABLE ENERGY POLICY

CENTRAL EUROPEAN UNIVERSITY

3CSEP

Key Message 4: Infrastructure build-up over the next few decades will result in significant emissions

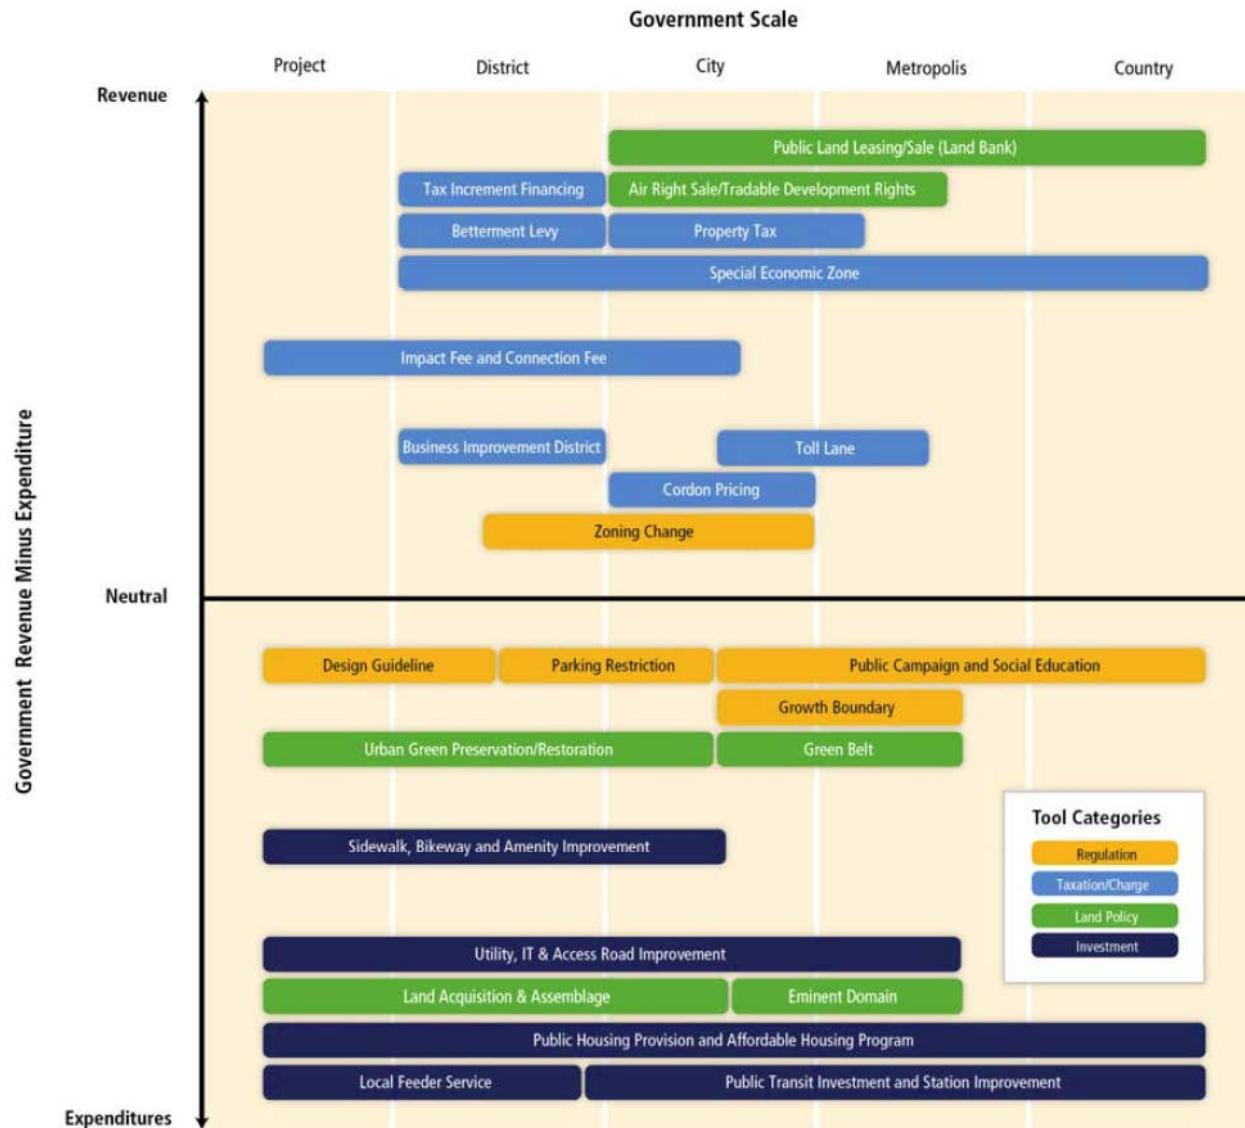

Total CO₂ emissions (per capita) needed to build up today's infrastructure

Key Message 4: Infrastructure build-up over the next few decades will result in significant emissions

Key Message 5: Large mitigation opportunities exist where urban form is not locked in, but often where there are limited financial and institutional capacities

Key Message 6: Thousands of cities are undertaking climate action plans, but their impact on urban emissions is uncertain

Summary

1. Urban areas contribute considerably to global primary energy demand and energy-related CO₂ emissions.
2. The feasibility of spatial planning instruments for climate change mitigation depends highly upon each city's financial and governance capability.
3. Urban planning mitigation options include:
 1. increasing accessibility
 2. increasing connectivity
 3. increasing land use mix
 4. increasing transit options
 5. increasing and co-locating employment and residential densities
 6. increasing green space and other carbon sinks

1. The building sector is responsible for a high share of emissions

In 2010, the building sector accounted for

- ❖ 117 EJ or 32% of global final energy
- ❖ 25% of energy-related CO₂ emissions (9.2 Gt CO₂e)
- ❖ 51% of global electricity consumption
- ❖ a significant amount of F-gas emissions: up to a third of all such emissions
- ❖ app. one-third of black carbon emissions

Challenge #1

but if only direct emissions are reported, buildings are insignificant

Allocation of Electricity/Heat Generation Emissions to End-use Sectors for 2010

Source: Figure A.II.2

Historical development of emissions by sector (fig 5.18)

(note: direct emissions only)

Baseline Scenarios: Direct vs. Indirect Emission Accounting

Source: Figure SPM.10, TS.15

Importance of building sector emissions

- ❖ In developed countries most future building emissions can be affected by retrofits....
- ❖ ...while in developing countries through new construction.

Lesson #4: DURABILITY

Durability of (energy-efficient) buildings and their components are crucial in determining their mitigation cost-effectiveness;

as well as improve their mitigation potential due to reduced embodied emissions

Figure 9.14. Cost of conserved energy as a function of energy performance improvement (kWh/m²/yr difference to baseline) to reach 'Passive House' or more stringent performance levels, for new construction by different building types and climate zones in Europe

BUILDING TYPES

Studies on employment effects due to improved building energy efficiency

Further co-benefits, details

- ❖ monetizable co-benefits alone are at least twice the resulting operating cost savings.
- ❖ Energy efficient buildings may result in increased productivity by 1–9% or even higher.
- ❖ Productivity gains can rank among the highest value co-benefits when these are monetized, esp. in countries with high labour costs
- ❖ Significant potential energy security gains:
 - ❑ e.g. a CEU study found that deep retrofitting the Hungarian building stock can save 39% of natural gas imports, and up to 59% of January imports (when most vulnerable to supply disruptions)

While opportunities are great, there is also a substantial lock-in risk

CENTER FOR CLIMATE CHANGE
AND SUSTAINABLE ENERGY POLICY

CENTRAL EUROPEAN UNIVERSITY

“Infrastructure developments and long-lived products that lock societies into GHG-intensive emissions pathways may be difficult or very costly to change, reinforcing the importance of early action for ambitious mitigation” (SPM 4.2)

Lesson #4: need to go for the highest-tech

Building efficiency programs and policies need to encourage only the highest achievable efficiency levels. Shallow retrofits need to be avoided. It is better to “wait out” the opportunities for a deep, systemic retrofit rather engage in a shallow one. Most countries would need to revisit their support schemes and policies around retrofit!

Summary of lessons relevant for the PH community 1.

- ❖ External communication needs to improve
 - ❑ reporting achievements, costs, penetration to other communities
 - ❑ e.g. the academic literature
- ❖ Much stronger focus on very deep retrofits are needed in developed countries (as opposed to just new)
- ❖ in other areas, preventing the need for mechanical cooling is essential.
- ❖ Bringing down the costs of deep retrofits through experience is crucial

Increasing urban density is a necessary but not sufficient condition for lowering urban emissions
